In chemistry, a salt is a chemical compound consisting of an ionic assembly of cations and anions. Salts are composed of related numbers of cations (positively charged ions) and anions (negatively charged ions) so that the product is electrically neutral (without a net charge). These component ions can be inorganic, such as chloride (Cl^-), or organic, such as acetate (CH_3CO_2^-); and can be monatomic, such as fluoride (F^-) or polyatomic, such as sulfate (SO_4^{2-}). Salt definition: Salt is a strong-tasting substance, in the form of white powder or crystals, which is used to improve the flavour of food or to preserve it. Salt occurs naturally in sea water. Season lightly with salt and pepper. ...a pinch of salt. Salt is a compound consisting of a positively charged metal ion (cation) bonded with a negatively charged ion (anion), which makes most salts soluble in liquids consisting of polar molecules (the most popular being water). The best known salt is sodium chloride (NaCl , common table salt). All salts taste salty, but some, such as arsenic or plutonium salts, are not recommended as table seasonings. Excessive salt consumption can increase the risk of high blood pressure. Evelyn Salt is a CIA agent and highly respected by all, including her boss, Ted Winter. Out of the blue, a Russian spy walks into their offices and offers a vital piece of information: the President of Russia will be assassinated during his forthcoming visit to New York City to attend the funeral of the recently deceased U.S. Vice President. The name of the assassin: Evelyn Salt. Concerned about the safety of her husband, who she cannot contact, she goes on the run. Winter refuses to accept that she is a mole. Salt is a mineral, composed primarily of sodium chloride, which is commonly eaten by humans. There are different forms of salt: unrefined salt (such as sea salt), refined salt (table salt), and iodized salt. It is a crystalline solid, white, pale pink or light grey in color, normally obtained from sea water or rock deposits. Natural sea salt includes vital trace minerals in addition to the sodium chloride. Edible rock salts may be slightly greyish in color due to this mineral content.
