One in a series of 7 excellent value books. **Get A Copy.** Ladybird larvae are nature's natural pest control. The ladybird larvae eat insect pests such as greenfly, aphids, spider mites etc. This product is NOT suitable for ladybird breeding kits - SEE B003VGG4P0 INSTEAD. As they are supplied as larvae, they are ideal for releasing directly onto plants heavily infected with pests - as they are unable to fly and will stay where you put them. After several weeks they will pupate to produce ladybirds, which will continue to feed, breed and produce the next generation of larvae. The beetles we call ladybirds (ladybugs) number about 50 species in Britain and many are common in gardens. They are more than just pretty insects to have about the place: they are very useful! Their voracious appetite for aphids (greenfly, blackfly) make them important biological control agents for these important pests. As such, ladybirds are the gardener's ally in the constant battle against aphids and insects which compete with us for our vegetables and damage our flowering plants. This book outlines the fascinating natural history of ladybirds and how some lead quite specialised lives
