Human Physiology is an international peer reviewed journal aimed at promoting the integration of theory, methods, and research in human physiology. The journal publishes original studies on brain function and its disturbances, including neural mechanisms subserving perception, learning, memory, emotion, and language. Human Physiology provides a forum for many areas of physiology, such as respiration, circulation, the blood system, motor functions, and digestion, as well as sport and occupational physiology. Probiotics are essential in human physiology. They play a vital role in providing immunity, producing Vitamin K, relieving lactose intolerance and shortening diarrhea. Besides; it promises the management of Atopy and other incurable conditions.Â Background. Nursing students perceive human physiology as one of the most challenging courses, and it is also the course most often failed. Human physiology is a life science and a branch of animal physiology. It is specifically the study of how systems of the body function in a well state, and this analysis of function is often at the cellular level, not of single cells but of how cells work in concert to achieve a normal state of function. Basic human physiology studies the bodyâ€™s systems that function appropriately and as expected, while other disciplines like pathophysiology may look at the way body systems develop disease in attempts to find insight into how to cure diseases. Thus, human physiology deals specifically with the physiological attributes of the human body at various levels of organization, i.e. from cellular to tissue and ultimately, physiology at the biological system level. Human physiology is important because it imparts an in-depth understanding of the vital processes that the body does so as to attain the utmost goal of maintaining homeostasis. Objectives. To fully understand the mechanisms of human physiology.
