Marine Biology covers the basics of marine biology with a global approach, using examples from numerous regions and ecosystems worldwide. This introductory, one-semester text is designed for non-majors. Authors Castro and Huber have made a special effort to include solid basic science content needed in a general education course, including the fundamental principles of biology, the physical sciences, and the scientific method. This book is the fourth companion volume to 'An Introduction To Using GIS In Marine Biology'. It is designed to augment the information on using GIS in marine biology provided in that book, and, indeed, to be used alongside it rather than to be used independently as a stand-alone volume. Unlike most other GIS tutorials, this information is specifically presented in a marine biological context and all the exercises use real data from a marine biological study. Therefore, these exercises are more likely to provide the kind of experience in using GIS that marine biologists will find useful and applicable to their own research. These exercises are presented in the same easy-to-follow flow diagram-based format first introduced in the 'How To...' section of 'An Introduction To Using GIS In Marine Biology'. They are accompanied by images which show the user how th ArcGIS is major GIS software used for landuse purposes. i dont have any idea of ita application in the field of marine ecology. you can find linux based free software regarding your application. Cite. 22nd Mar, 2012. Rudy Bonn. Independent Researcher. It will depend of your particular study (population biology, sediment classification, experiments with tagged animals, etc), but one of the most popular and with developed-tools is ArcGIS, others are Arc View, Idrisi. Recently I had began use Grass but it's soon to give at least an objective evaluation. It written for marine biologists by a marine biologist, and all exercises use data from a real marine biological research project.
