General characteristic of the discipline statistical methods of scientific research. The work program of the discipline is compiled in accordance with the requirements of the Federal State Educational Standard for Higher Professional Education. The purpose of the discipline is to develop the practical skills of statistical analysis of business processes at the enterprise. The study of the discipline "Modern Statistical Methods of Scientific Research" is aimed at solving the following tasks - critically evaluate the results obtained for their reliability and suitability for planning and forecasting purposes. KNOW: - the specifics and characteristics of various statistical methods used in scientific research in the field of economics and finance (3) Resampling methods using many randomly computer-generated samples are finally introduced for estimating characteristics of a distribution and for statistical inference. The following section deals with methods for processing multivariate data. Statistics can be called that body of analytical and computational methods by which characteristics of a population are inferred through observations made in a representative sample from that population. Since scientists rarely observe entire populations, sampling and statistical inference are essential. The standard conservative approach developed by Bonferroni [3] consists of dividing the p-value threshold by the number of comparisons performed. For example, for 100 tests performed at $p=0.05$, the corrected p value is $0.05/100=0.0005$. Use Of Statistics To D by Grant T. Wernimont. Other editions. Want to Read saving Error rating book.
